Making Addiction a Brain Disease: A Social History of Addiction Neuroscience

Nancy D. Campbell, Ph.D.
Jerome H. Jaffe

... I have fought this issue of "relapsing brain disorder" since somebody decided that this is the current mantra. The model of dependence that we favor is a complex interplay between environment and what may very well be a long-lasting sense of greater sensitivity to drug-related stimuli. Obviously, to the extent that aspects of drug dependence involve learning and changed responsivity to stimuli there are changes in the brain...
The Opium Problem (1928)
Death in morphin [sic] poisoning is a brain death.

The central nervous system is the most severely affected in morphin poisoning. The alterations in this, because of their intensity and regular occurrence, are in the foreground of the pathologico-anatomic picture of poisoning. . . . Death in morphin [sic] poisoning is a brain death. In the most acute form of poisoning, distinct brain alterations are already apparent . . . . a matter of a chronic brain process, which had been going on for some time, overlaid by acute alterations.”

His brain has become addicted, but not his liver

The medical interest lies in the fact of the man accustomed to a poison becoming sick. He is sick because the poison taken habitually, while it fixes certain cells and confers on them increased activity or passivity, also renders these or other cells unserviceable for other functions, non-resistant to other influences. . . . His brain has become addicted, but not his liver. The morphinist has acquired high tolerance in certain regions of the brain.

The Light of a New Day

PUBLIC ENLIGHTENMENT

FEDERAL NARCOTICS FARM

With the federal government opening its two first farms for the cure of narcotic victims, historic progress is recorded in the humanitarian treatment of a serious problem. This movement should be carried rapidly on. There should be a narcotic-cure farm in every state of the Union. It is a deplorable fact that ONLY A FEW of the states have adopted the Uniform State Narcotic Law, which is necessary to build up the nation's defenses against the "dope" evil. Numerous legislatures are now in session. In each of the laggard states IMMEDIATE enactment of the Uniform State Narcotic Law should be compelled by local public opinion. Failure to adopt the measure will be inexcusable.
Committee on Drug Addiction (CDA)

1. scientific investigation of narcotics and analysis of chemical & biological literature on addiction alkaloids;
2. formulation of rules and regulations for legitimate use of alkaloids having addiction properties;
3. education of physicians and public;
4. “replacement of all present use of addiction alkaloids by substitutes having no addiction properties”
William C. White, CDA chair, 1929-1947

“Since no one drug can function for all of these uses, it is necessary to replace the legitimate uses of morphine with a number of substitutes.

...[This] should render morphine an unnecessary commodity in international commerce.”
PRE-WORLD WAR II
1930s

• Charted Morphine Abstinence Syndrome
• Showed patent medicine “cures” ineffective
• Determined addicts were not less intelligent than non-addicts
• Showed body shape and size (morphology) irrelevant
• Developed methods to track physiological tolerance, severity of dependence, and intensity of withdrawal
First Generation

Biophysicist Howard L. Andrews; Ralph Brown
Robert H. Felix (founding director of NIMH)
Justin K. Fuller (former CMO Ft. Leavenworth)
Michael Pescor; Biochemist Fred W. Oberst
Surgeon William F. Ossenfort (later CMO Atlanta Penitentiary)
Clinical Psychiatrist Victor H. Vogel
Physiologist Edwin G. Williams
Second Generation

Harris Isbell succeeded Himmelsbach as research director in 1945.

Chemist Anna J. Eisenman, among first women to graduate from Yale University.

Biophysicist Karl Frank; H. Franklin (Frank) Fraser; Harris Hill; Conan Kornetsky; Richard Belleville in psychometrics.

Abraham Wikler.
Modal addict, 1935
White male, age 45 or older, casual labor or unemployed, “drifter”
Section on Analgesics, National Institute of Arthritis and Metabolic Diseases, c. 1958
Harry J. Anslinger, FBN Chief

An egotist will enjoy delusions of grandeur, the timid individual will suffer anxiety, and the aggressive one will resort to acts of violence and crime. Dormant tendencies are released and while the subject may know what is happening, he has become powerless to prevent it. . . . The drug has a corroding effect on the body and on the mind, weakening the entire physical system and often leading to insanity after prolonged use.
POST-WORLD WAR II
Late 1940s/early 1950s

- Discovered methadone effective for detox...but ‘postaddicts’ liked it too much
- Calculated methadone dosage for medically assisted detox on clinical side
- Demonstrated barbiturates addictive and withdrawal life-threatening
- Warned barbiturate users not to operate heavy machinery
- Showed ‘delirium tremens’ (d.t.s) were signs of alcohol withdrawal
POST-WORLD WAR II

1950s

• Reversed opiate overdose with nalorphine
• Developed criteria, reliable methods to predict abuse liability of new compounds
• Studied role of conditioning in relapse, and relapse after long drug-free periods
• Advanced “drug dependence” as term to destigmatize “addiction”
The Relation of Psychiatry to Pharmacology

“augmentation of a tendency to respond invariably under varying environmental conditions in accordance with those reaction patterns which are most ‘stable’ for the individual” (Wikler 1957, 246).
“[l]t is the human brain, which is heir to disorders that one cannot produce in lower animals like schizophrenia and other mental illnesses, it is the human brain that experiences profound sorrow, laughter, jests, incites, and it’s the human brain that can speak and reveal its’ inner workings to some extent.” (ACNP Oral History Interview with Seymour Kety, p. 4)
Revolutionary Center for Medical Research Dedicated

it will contain all modern atomic energy means of treating patients as well as laboratories to prepare medications containing radioisotopes. An unusual feature of the radiation wing is the provision of rooms for patients, making possible supervised control of radioisotopes for diagnosis and treatment.

Dr. Schell emphasized that psychological and spiritual factors in the treatment of patients suffering from often-irremediable long-term diseases had received their place in the Clinical Center. This phase even included the calling in of color experts to supervise the entire decoration.

On the top floor, where the operating rooms are finished in soft green tile, is a huge gymnasium-like room that will be used for the type of physical rehabilitation pioneered by Dr. Howard A. Rusk, director of the Institute of Physical Medicine and Rehabilitation, New York University-Bellevue Medical Center, and associate editor of THE NEW YORK TIMES.

There also is a dignified chapel, with a revolving stage presenting in turn the altars of the Protestant, Catholic, and Jewish faiths. It will always be open for meditation.

Each Floor Has Sunroom

Medical and psychiatric social work and recreational therapy will be carried out through the wards. A central sunroom on each floor will serve as a gathering place for ambulatory patients.

More than ninety doctors are now on the staff of the seven
POST-WORLD WAR II
1960s – 1970s

• Developed Addiction Research Center Inventory (ARCI) to classify drugs
• Provided first pharmacologic evidence of existence of multiple opiate receptors
• Pioneering studies of buprenorphine as treatment for opiate addiction
The glory of Lexington was that from a description of human pathology could come a pharmacological hypothesis. Lexington was a network of researchers asking very basic questions all the time, totally protected from political factors in ways that allowed us to be free to explore anything. That period has influenced me . . . to link the molecular to the global picture of the addictive process.
Addiction Research Center findings

• Narcotic antagonists can reverse overdose
• Dangers of barbiturates, warning labels
• Methadone can assist detoxification
• Conditioning to social and environmental cues plays role in relapse
• Some changes in addicts persist after drug exposure
• Addiction Research Center Inventory (ARCI)

BROKEN

MY STORY OF ADDICTION
AND REDEMPTION

“William Cope Moyers’s lucid, measured tale of his own plunge into crack-addled hell is [in] frightening in its very realism.” — USA Today
Research has taught us that addiction is a complex disease, influenced by a multitude of highly entangled factors, with genetic, behavioral, environmental, and developmental factors all contributing.

"All these differences seem to reveal a space indicating the operation of choice in the construction of scientific knowledge. Yet the moment we attempt to juxtapose the representational plasticity of scientific theories with their instrumental efficacy, this space seems to disappear before our eyes, leaving in its place an aura of inevitability."
“Drug abuse is a far more complex phenomenon than previously thought, and it is now recognized that drug abusers represent a highly heterogeneous group, and the patterns leading to dependence are diverse. ...”
What are called “behavioral effects” are not isolated, elementary changes in “consciousness,” “perception,” “emotion,” “ideation,” or “learning,” which are simply increased or decreased by “stimulants” or “depressants,” but complex patterns of change, proceeding in time, . . . and dependent not only on the drug administered, but also on biographical and environmental factors as well as on the activities of the observer. . . . (Wikler 1957).
